"Mechanisms and Ontogenesis of Corrections in Some Motor Reactions of Man"

Sofia, Ekspperimentalna Meditsina i Morfologiya, Vol 5, No 2, pp 110-114

Abstract: Study of motor reactions in adults and children in an experimental setup which involved tracing of straight lines on a moving band indicated that correction of the trajectory and speed of movements is based on natural reflex associations and that the capacity for correction develops in the course of ontogenesis, while the resistance to effects which produce deviations increases. Graphs, 5 references (all Bulgarian). Manuscript received Jun 64. Russian and English summaries.

Title : The Adoption of the Properties of Conditioned
Stimuli in the Process of Acquisition of Habits
in Man.

Orig Pub: Dokl. Bolg. AN, 1956, 9, No 4, 89-92.

Abstract: Adoption of the properties of conditioned signals
occurs in the process of acquisition of motion ha-
bits in the adult man; this determines the pathway,
duration, speed and the mechanical force of the
kinetic reactions and also the status of the pos-
tural reflexes (static reflexes). The greater the
speed of the moving signal, the shorter was the

Title : ~~Assembly and adjustment of steam valves mechanism~~
in locomobiles

Periodical : Energetik, no.2, 30-34, F 1955

Abstract : Unlike stationary steam engines, locomobiles have 3 instead of 4 pairs of steam valves of the double-seat, balanced type actuated by 2 camshafts. The author gives a full description of these valves, adjacent parts, their operation and method of assembly, and practical rules for adjustment of the whole process of steam distribution. Five drawings and one chart.

TITLE: On the Displacement of the Locomobile Crankshaft Axis When the Shaft is Being Warmed-Up (Smeshcheniye osi kolenchatogo vala lokomobilya pri nagrevanii)

PERIODICAL: Energetik, 1958, Nr 2, p 35-36 (USSR)

ABSTRACT: The locomobile crankshaft axis is displaced by 4 to 8 mm when the engine starts working. Since the permissible displacement is only 0.05 to 0.50 mm, it is necessary to interfere to prevent axis-line break or actual shaft rupture. The author proposes a formula for computing the axis displacement of a warmed-up crankshaft. He gives a practical example by applying the formula to a loco-

AUTHOR: Gidon, L.M., Engineer

TITLE: On Vibration in the Locomobiles "Sampo-400"

PERIODICAL: Energetik, 1959, Nr 6, pp 16-18 (USSR)

ABSTRACT: The author examined the locomobile "Sampo-400" with a hand vibrograph VR-1, in order to check the correctness of vibration data contained in the article by A.A. Kornilov and N.A. Izyumskiy, published in this periodical, Nr 6, 1958, and established that the vibration values indicated therein were exaggerated. Then the author provides a rudimentary explanation of the origin of vibrations in the locomobile itself and in the steam engine. There are 2 sets of diagrams.

TITLE: The effect of composition and low-temperature thermomechanical
treatment on the mechanical properties of structural steels

PERIODICAL: Metallovedeniye i termicheskaya obrabotka metallov, no. 4,
1963, 36 - 40

TEXT: An investigation of the thermomechanical strengthening of
steels of various compositions revealed some characteristic features of the
alloying effect. Amounts of up to 1.2 - 1.5% Si, particularly in combination
with V, permit an increase of the tempering temperature to 350°C without
considerable reduction of the strengthening effect during low-temperature
thermomechanical treatment. An increase of the Cr-content from 1.5 to
3 - 5% makes also the strength level rise. The effect of low-temperature
thermomechanical treatment of steels containing 3 - 5% Cr alloyed with Mo,
V and W is, to a considerable extent, maintained in tempering up to 500°C
with a comparatively increased ductility. Steels with the composition (in %
0.42 C, 1.13 Si, 0.68 Mn, 3.01 Cr, 1.28 Ni, 0.39 Mo, 0.14 V and 0.39 C,

Title : Changes in Human Organism During Work in Conditions of Dry Heat in an Insulated Gasmask and Without It.

Orig Pub : Acta physiol. polon., 1956, 7, No 2, 169-184.

Abstract : In 130 healthy mining rescuers in a chamber with a temperature of 39-47° and low humidity and with radiation and movement of air, the hemodynamic was studied both at rest and during performance of standard physical work in the course of 2 hours. In 49 rescuers working without gasmasks, there was noted an average a drop in the weight of 1.45 ± 0.05 kg, rise of oral temperature to $37.56 \pm 0.07^\circ$, armpit temperature $37.5^\circ \pm 0.08^\circ$, rectal $38.1 \pm 0.11^\circ$.

Title : Type B Renal Diabetes.

Orig Pub : Polski tygod. lekar., 1956, 11, No 4, 158-163

Abstract : A case of Renal Diabetes. Maximal resorption of glucose was 3.2 mg per minute; daily urinary phosphate came to 0.375 g; daily excretion of amino acids was 0.868 g. Glucosuria was higher during the day than at night. During daytime sleep produced by luminal glucosuria was considerably reduced for a period of 8 hours. The attendant changes in glycemia were of a typically diabetic character. During insomnia resulting from the use of caffeine glucosuria was twice as great as after ordinary sleep. Use of ACTH, adrenalin, atropine and insulin did not affect the glucosuria.

796. The perspective vectorcardiogram of QRS syndrome in cases of bundle-branch block in the light of clinical observation Wektokardiogram perspektywiczny zespołu QRS w przypadkach bloku odnogi w świetle obserwacji klinicznej. GULE L. and Machowski W. III Klin. Chor. Wewn. St. Akad. Med., Bytom Pol. Tyg. Lek. 1958, 13/22 (848-851) Illus. 7

The authors investigated the behaviour of the perspective vectorcardiogram loop in 54 cases of various bundle-branch blocks. The conclusions from the previous work were confirmed on an enlarged material and a greater variety of different types of bundle-branch block was shown. The up-to-now results authorize the authors to assume that vectorcardiography will make possible a more exact differentiation of bundle-branch blocks than normal electrocardiographic examination. Clinical analysis of the material obtained allows them to suppose that some types of the left bundle-branch block in vectorcardiogram depend on the left ventricular hypertrophy. The authors suggest that it will be possible to show the practical significance of isolated types of bundle-branch block only by observing the connection between the type of bundle-branch block and the histopathological lesions of the myocardium.

EXCERPTA MEDICA Sec 6/Vol 13/6 Internal Medicine June 59

2761. THE PERSPECTIVE VECTORCARDIOGRAM OF THE QRS SYNDROME IN CASES OF BUNDLE-BRANCH BLOCK - Wektokardiogram perspektywiczny zespołu QRS w przypadkach bloku odnogi - Giec L., Gibinski K. and Imielinski K. III Klin. Chor. Wewn. Śląskiej Akad. Med., Bytom - PRZEGI. LEK. 1958, 14/3 (71-75 and 96) Graphs 11

Twenty-five cases were examined. The pictures obtained were divided into groups of left and right bundle-branch block. Further investigations are essential in the field of perspective cardiography, which may be a better and more accurate method than ECG for the differentiation and localization of bundle-branch block, especially since, on the basis of the material examined, it appears that the ECG criteria perhaps fail to include all cases of BBB. Title : Effect of Moisture Content of Wood on the Yield of Products
of Thermal Decomposition
Orig Pub : Prace Inst. technol. drewna, 1957, 3, No 4, 15-33
Abstract : With increasing moisture content of the wood an increase
takes place in the yield of aqueous distillate, and to a
lesser extent in that of acids, CH_3OH and charcoal.
Increased moisture content has a detrimental effect on the
yield of uncondensable gases and tar. It is shown that op-
timal moisture content of wood that is subjected to distil-
lation is 12-18%.

Prof. dr hab. Gieciwiczowa P. Corrosion of Certain Metals by Products of Destructive Wood Distillation.
„Badania nad korozją niektórych metalów przez produkty rozkładu destylacji drewna”. (Prace Inst. Technol. Drewna. No. 3), Poznań, 1960, PWN, 12 pp., 9 figs., 12 tabs.
Investigations were undertaken to study the effect of certain derivatives of destructive wood-distillation on certain metals, and to ascertain which metals are most suitable for manufacture of parts of industrial apparatus. An examination was made of the effect on Polish made copper M₂, Polish 5 Al (KMB), acid-resistant steel, and aluminium (99% of pure Al content) of the following products: 1) raw mixture; 2) extract (4.8% of vinegar acid content); 3) black acid (57% of vinegar acid content); 4) waste liquors (0.4% of vinegar acid content). Tests were carried out under conditions resembling those in industry. The investigations resulted in the following order of suitability of the three metals for apparatus intended to be kept in contact with black acid: aluminium — average loss in weight of samples after 140 hours, liquid state 1.8% and volatile state 0.8%; steel — comparable loss in weight 1.1% and 12.8%; steel, acid resistant — lowest resistance to black acid, average loss in weight, respectively 45.4% and 76.3%. Steel showed, on the other hand, relatively good resistance to raw mixture (loss in weight of samples after 140 hours was 0.8% for liquid and volatile state alike); least

100

6
HERC

Corrosion of Certain . . . 6
resistant in this respect was aluminum (with 17% loss in weight for liquid state and 8% for volatile). A fairly good resistance to waste liquids was shown also by acid resistant steel (loss in weight of samples after 140 hours, liquid state 0.8% and volatile state 3.3%); copper came next (comparable percentage losses — 3.2% and 0.8%). Aluminum was found to have a lower resistance to the action of waste liquid. Acid resistant steel is not affected by action of the extract (loss in weight of samples after 600 hours was, for liquid and volatile state, 0.8%). Copper was somewhat corroded by extract (loss in weight 4.5%).

CH_3COOH), to waste waters (3.4 percent CH_3COOH) and to gaseous media was investigated. The obtained results indicate that:
1) Al possesses the greatest stability to black acid under operating conditions of the equipment involved (the decrease in weight in the liquid phase - 1.6 percent, and of the gaseous phase - 0.8 percent); Cu is the next (decrease in weight when in the liquid phase - 1.1 percent, when in the gaseous phase - 12.5 percent); the acid-resistant steel is unstable under the above conditions. 2) In the raw liquor the most stable

material is the acid resistant stool
(decrease in weight when in the vapor
phase was not detected); the least resi-
stant is Al. 3) In the waste water, the
acid resistant stool is the most stable
material (the decrease in weight, when in
the liquid phase is 0.0 percent, in the va-
por phase it is 3.3 percent); Cu is the next
(the decreases in weight are 0.0 percent and
3.2 percent in liquid and vapor phases respec-
tively). The resistance of Al is less than
those of steel and copper. 4) As for the ex-
tract (experiment of 600 hour duration), the
